

LUMENARI

Welcome to your Lumenari kit

Everything you need to make your AI work like a senior teammate.

WHAT'S IN YOUR ZIP

The five files you'll use

Every Lumenari kit ships with the same five-file structure. Different AIs read different formats — these cover all of them.

SKILL.md

The Claude Code / Cowork SKILL standard format.

Use this in Claude Code, Claude.ai with skill packs, or any tool that supports the SKILL format.

optimization-pack.md

A paste-able system prompt that works in any chat AI.

Use this in Claude.ai, ChatGPT, Gemini, Perplexity, Grok — anywhere you can set custom instructions.

custom-gpt-instructions.md

Pre-formatted Instructions field for ChatGPT's Create-a-GPT.

Use this if you want a dedicated ChatGPT for this domain, sharable to your team.

memory.md

Domain context — vocabulary, workflows, tone, common pitfalls.

Pair with any of the above for an AI that already knows your industry.

quick-start.md

The 3-step path to first value.

Read this first if you want to be productive in five minutes.

Drop in. Restart. Done.

Claude Code and Cowork auto-discover skills in your skills folder. No commands to register, no config to edit.

- 1 Create the kit folder under your Claude skills directory.

```
mkdir -p ~/.claude/skills/<kit-name>
```

- 2 Move SKILL.md (and any reference files in the kit) into that folder.
- 3 Restart Claude Code (or reload Cowork). The skill is now live.
- 4 Just describe what you want — e.g. 'help me ship this feature.' Claude picks the skill automatically when your request matches.

Verify it loaded

Open a fresh Claude Code session and run `/skills`. Your new kit should appear in the list. If not, check that SKILL.md is directly inside `~/.claude/skills/<kit-name>/` (not nested deeper).

Build a private GPT for your team

Custom GPTs let you bake the kit's voice and behavior into a permanent assistant — linkable, shareable, no setup for the people you give it to.

- 1 Open custom-gpt-instructions.md from the zip and copy the entire contents.
- 2 In ChatGPT, click Explore GPTs > Create (top-right). Use the Configure tab.
- 3 Paste the contents into the Instructions field. Add a name, description, and (optionally) a profile image.
- 4 Save the GPT — keep it private, or share it inside your team.

Quick tip

If you have ChatGPT Team or Enterprise, share the GPT with a workspace instead of publishing it publicly — your kit-derived instructions stay private to your org.

One paste, instant uplift

The optimization-pack.md is the universal route. Any AI that accepts custom instructions, system prompts, or personas will read it.

- 1 Open optimization-pack.md and copy everything.
- 2 Paste it into the system prompt / custom instructions / persona field of your AI.
- 3 Start chatting — the AI now thinks like the kit's persona without any further setup.

Where to paste it

- Claude.ai > Settings > Profile > Personal preferences
- ChatGPT > Settings > Personalization > Custom instructions
- Gemini > Saved info (Gemini Advanced)
- Cursor / Windsurf > .cursorsrules or rules-for-AI
- Any API call > first system message

PRO TIPS

Get more out of your kit

- Pair `memory.md` with `optimization-pack.md` for an AI that knows your industry vocabulary on top of the kit's general skill.
- Start with `quick-start.md` — it's the fastest path to first value, and tells you what the kit is really good at.
- Layer kits. There's no rule against giving one AI two kits — paste both optimization-packs back-to-back in the system prompt.
- When the AI drifts, paste the relevant section of `SKILL.md` back into the conversation. Mid-session reinforcement works.
- If you bought a bundle, the welcome doc applies to every kit in the zip — each kit has its own `/kits/<slug>/` folder inside.
- Found a workflow worth saving? Drop it into `memory.md` and re-paste. Your AI gets smarter every time you use it.

Need help?

We answer every email. Tell us what AI you're using and what you're trying to do — we'll get you unstuck.
